

Boot To Root Challenge

Complete anatomy of the machine

System Specs

Ubuntu Linux Server or any other if needed

2048mb ram, around 1-2 gb (Will be decreased if needed) vm-size pre-NAT configured.

Ports	Description
22	The main port available to the users for their hacking. Requires a password or a private key to be accessed. This is the initial foothold everyone will be accessing.
666	This is the port on which a small game is to be played by the users to get access to the encoded RSA private key
1001	This is the port to be connected by the user to access a small game of finding the correct username by guessing.

The above is for finding the **user.txt** file and getting an initial access. After which root access has to be taken

A file will have the root password encoded in different formats and stored in a location which will be available to be read which is **root.txt** and that is how the challenge is going to be completed.
